

High dust retention capacity

Filters for electric tools

Hengst supplies both filter inserts and complete filter modules to the manufacturers of power tools. Because of their widely spaced pleats (ProClean System), these filters are characterized by a high dust retention capacity and optimum ease of cleaning.

The filters can be supplied in the form of filter cartridges or as flat pleat filters. It goes without saying that Hengst works closely with the user during the development phase to define optimum solutions. Additional test devices can be designed at the customer's request. Major users of these products include grinding machinery, jack hammers and masonry groove cutters.
