

Flexible solutions

Filters for special applications

Special applications always represent a special challenge for Hengst. Our goal is to provide comprehensive support for the solution, from the initial concept to technical support. Years of experience guarantee fast development times. Some of the solutions we have developed and brought to market with OEMs are listed below:

Filter elements for livestock heaters. The filters are used for intake air filtration in gas heaters. The washable filters use polyester media. Maximum reliability and safety are guaranteed by the use of heat-resistant materials.

Filter elements for rainwater filtration: Cyclone filter with patented support fins guarantee more than 95% effectiveness. Adhesive forces draw the fluid through the filter fabric to the clean-water side.

Filter elements for equipment cabinet air conditioning systems: Innovative, patented pleated filters significantly increase the airflow while guaranteeing protection class IP55. The service life of the filter can also be increased by pleating, which lengthens the specified service intervals.

Filter elements for natural gas filtration: These special solutions have been used successfully for many years.
